The SPS (Spark Plasma Sintering)/DCS discharge plasma sintering system is one of the most advanced sintering systems in the world today. It is a new rapid sintering technology that applies pulse current and axial pressure between two electrodes to densify powder sintering. It has distinct characteristics such as fast heating rate, short sintering time, controllable organizational structure, energy conservation and environmental protection. It can be used to prepare metal materials, ceramic materials, composite materials, as well as nano bulk materials, amorphous bulk materials, gradient materials, etc. In addition, SPS/DCS equipment also provides the possibility for the manufacturing of very special new materials, such as nanomaterials, functionally gradient materials, composite materials, tungsten carbide, silicon nitride, silicon carbide or other hard materials, structural ceramics, and functional ceramics, which can be sintered without significant grain growth.

## The main advantages of the SPS/DCS equipment of Haoyue Company:

# 气压烧结炉

GAS PRESSURE SINTERING FURNACE

G2透视图

## 特点

### ADVANTAGES

气压烧结设备特别适用于烧结在高温下易于分解或通过标准烧结工艺不能烧结的陶瓷或金属。和热烧结一样，在这一过程中没有对待烧结部件的限制或对几何形状的限制，它为更昂贵的HIP过程提供了一种有利的选择。

我们的气压烧结炉可以装备集成的热膨胀计，它能在烧结循环中测量收缩和收缩速度。在此获得的测量数据被用于过程控制。

在2200°C和10MPa (在N2或Ar中) 可以实现1升到500升的工作量。

气压烧结炉用于生产以下材料或部件：

- 具有良好机械性能的烧结氮化硅和硅铝氧氮聚合材料（比如切削工具、涡轮增压器发动机、发动机部件）
- 碳化硅陶瓷（在腐蚀条件下高机械应力件等）
- 超级合金（用于高温应用的机械应力件）
- 在带有较低钴含量的特殊烧结电石中的硬质金属，具有最优的机械性能和较高的质量
- 一般复合材料，主要应用汽车工业生产SSN批量零件。

Gas pressure sintering equipment is particularly suitable for sintering ceramics or metals that are easily decomposed at high temperatures or cannot be sintered through standard sintering processes. Like hot sintering, there are no restrictions on the treatment of sintered components or geometric shapes during this process, providing a favorable choice for more expensive HIP processes.

Our pneumatic sintering furnace can be equipped with an integrated thermal dilatometer that can measure shrinkage and shrinkage rate during the sintering cycle. The measurement data obtained here is used for process control.

a workload of 1 to 500 liters can be achieved at 2200°C and 10 MPa (in N2 or Ar).

Gas pressure sintering furnaces are used to produce the following materials or components:

- Sintered silicon nitride and silicon aluminum oxide nitrogen polymer materials with good mechanical properties (such as cutting tools, turbocharger engines, engine components)
- Silicon carbide ceramics (high mechanical stress parts under corrosive conditions, etc.)
- Super alloy (mechanical stress parts for high-temperature applications)
- Hard metals in special sintered calcium carbide with low cobalt content have the best mechanical properties and higher quality
- General composite materials are mainly used in the automotive industry to produce SSN batch parts.

## 简介

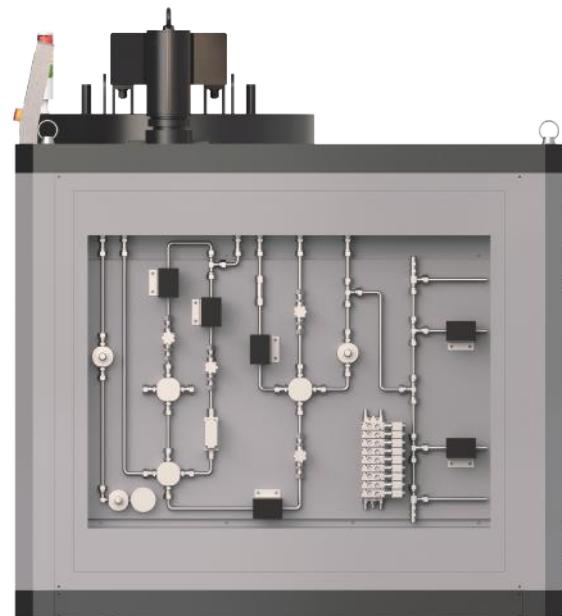

### BRIEF INTRODUCTION

气压烧结是指首先在低压状态下进行烧结工艺，然后在常压下烧结材料达到疲劳状态，后是在高气压下烧结(结果是进一步的增加材料疲劳状态并迅速的消除材料中的应力)，在高温高气压烧结工艺后，材料的各方面机械性能(硬度，强度，韧性等)都优于普通的烧结工艺。

Gas pressure sintering refers to the sintering process first carried out under low pressure, followed by sintering the material to reach a fatigue state under normal pressure, and then sintering under high pressure (the result is further increasing the fatigue state of the material and quickly eliminating stress in the material). After the high-temperature and high-pressure sintering process, the material's mechanical properties(hardness, strength, toughness, etc.) are superior to ordinary sintering processes in all aspects.

## 简介

### BRIEF INTRODUCTION

真空热压炉是在真空(或其它气氛)条件下将材料热压成型的成套设备，主要采用电阻或感应加热，由油缸驱动的压头上下加压。在高温下，物料生成固体颗粒的相互键联，晶粒长大，空隙(气孔)和晶界渐趋减少，通过物质的传递，其总体积收缩，密度增加，最后成为具有某种显微结构的致密多晶烧结体，从而将物料压制成形。

A vacuum hot pressing furnace is a complete set of equipment that forms materials by hot pressing under vacuum (or other atmosphere) conditions. It mainly uses resistance heating and is pressurized up and down by a pressure head driven by an oil cylinder. At high temperatures, the solid particles of the raw material bond with each other, resulting in grain growth, decreasing voids (pores) and grain boundaries. Through material transfer, its total volume shrinks, density increases, and finally becomes a dense polycrystalline sintered body with a certain microstructure, thereby pressing the material into shape.

## 简介

### BRIEF INTRODUCTION

该真空炉是可以用石墨/钼带/钨带/硅钼棒/钼棒等作发热元件的真空电阻炉，主要应用于陶瓷、硬质合金、复合材料、不锈钢等在真空或保护气氛中烧结，退火，钎焊，脱脂，脱气等，也可以供金属材料在高真空条件下的高温热处理或贵金属材料的除气处理。

The Vacuum furnace is a vacuum resistance furnace that can use graphite/molybdenum belt/tungsten belt/silicon molybdenum bar/molybdenum bar as heating elements. It is mainly used for sintering, annealing, brazing, degreasing, degassing, etc. of ceramics, hard alloys, composite materials, stainless steel, etc. in vacuum or protective atmosphere, and also for high-temperature heat treatment of metal materials under high vacuum conditions or degassing of precious metal materials.

## 特点

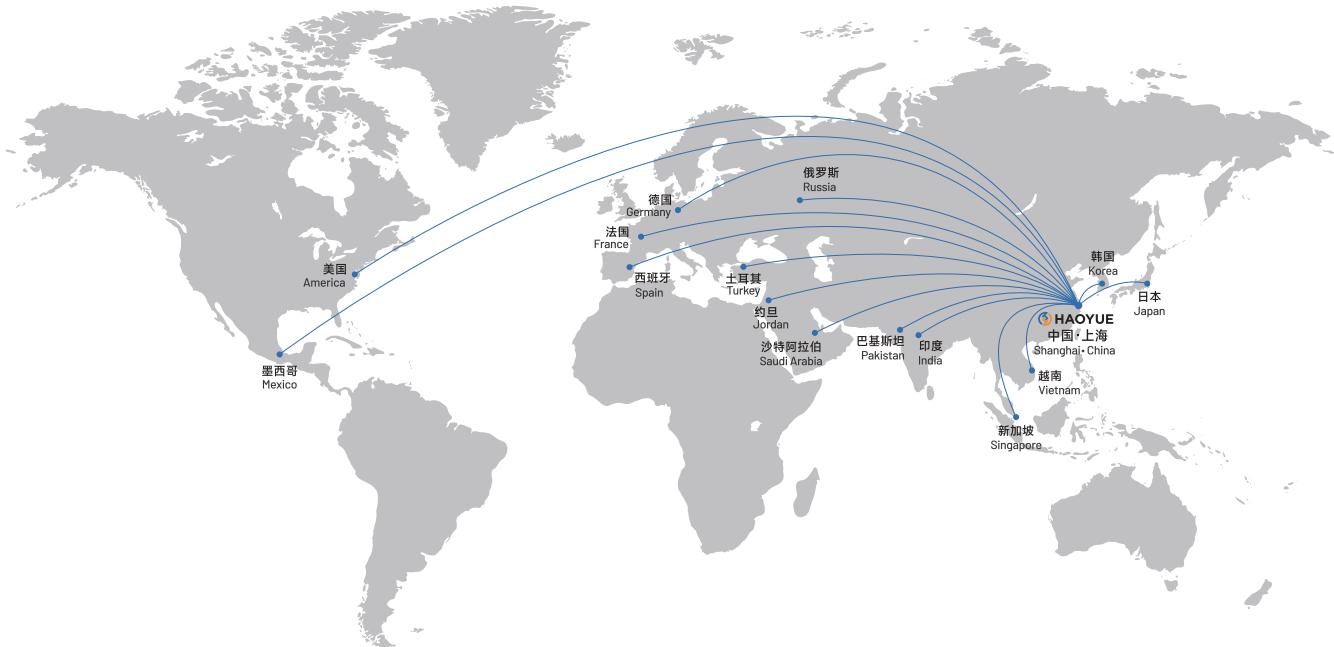

### ADVANTAGES

- 操作方便：采用卧式、侧开门结构：装、卸样品方便，操作方便；
  - 升降温快：感应升温速率100°C/分钟 ( $\leq 1600^{\circ}\text{C}$ )，电阻升温速率20°C/分钟 ( $> 1600^{\circ}\text{C}$ )；
  - 温度均匀性好：平均温度均匀性为 $\pm 5^{\circ}\text{C}$  (5点测温，恒温区1000°C保温1h后检测)；
  - 采用单温区控制：预留两个测温孔，以便高温监测使用；
  - 安全性能好：采用HMI+PLC+PID压力传感控制，安全可靠；
  - 可拓展性强：可烧结，钎焊，退火，脱脂，脱氢，脱气，还原，氧化等。
- 
- Easy to operate: Adopting a horizontal and side door structure: easy to load and unload samples, easy to operate;
  - Fast temperature rise and fall: induction heating rate of 100°C/min ( $\leq 1600^{\circ}\text{C}$ ), resistance heating rate of 20°C/min ( $> 1600^{\circ}\text{C}$ );
  - Good temperature uniformity: The average temperature uniformity is  $\pm 5^{\circ}\text{C}$  (measured at 5 points, with a constant temperature zone of 1000°C for 1 hour before testing);
  - Adopting single temperature zone control: reserving two temperature measurement holes for high-temperature monitoring use;
  - Good safety performance: Adopting HMI+PLC+PID pressure sensing control, safe and reliable;
  - Strong expandability: sintering, brazing, annealing, degreasing, dehydrogenation, degassing, reduction, oxidation, etc.
